

Ambiguous grammar: A CFG is said to be ambiguous if there exists more than one derivation tree for the given input string i.e., more than one **LeftMost Derivation Tree (LMDT)** or **RightMost Derivation Tree (RMDT)**.

Grammar with strings that have two or more distinct parse trees, are called ambiguous. Assigning a parse tree to a given string in the language is called parsing the string, it is an important first step towards understanding the structure of the string. Ambiguous grammars are of no help in parsing, since they assign no unique parse tree to each string in the language.

Example 1: Let us consider this grammar: $E \rightarrow E+E \mid id$ We can create two parse trees from this grammar to obtain a string **id+id+id**. The following are the two parse trees generated by left-most derivation:

Both the above parse trees are derived from the same grammar rules but both parse trees are different. Hence the grammar is ambiguous.

Example 2: Let us now consider the following grammar:

Set of alphabets $\Sigma = \{0, \dots, 9, +, *, (,)\}$

$E \rightarrow I$

$E \rightarrow E + E$

$E \rightarrow E * E$

$E \rightarrow (E)$

$I \rightarrow \varepsilon \mid 0 \mid 1 \mid \dots \mid 9$

From the above grammar String $3*2+5$ can be derived in 2 ways:

I) First leftmost derivation

$E \Rightarrow E * E$
 $\Rightarrow I * E$
 $\Rightarrow 3 * E + E$
 $\Rightarrow 3 * I + E$
 $\Rightarrow 3 * 2 + E$
 $\Rightarrow 3 * 2 + I$
 $\Rightarrow 3 * 2 + 5$

II) Second leftmost derivation

$E \Rightarrow E + E$
 $\Rightarrow E * E + E$
 $\Rightarrow I * E + E$
 $\Rightarrow 3 * E + E$
 $\Rightarrow 3 * I + E$
 $\Rightarrow 3 * 2 + I$
 $\Rightarrow 3 * 2 + 5$

Example 3: If G is the grammar: $S \rightarrow SbS|a$

To prove that G is ambiguous, there are need to find a $w \in L(G)$, which is ambiguous.
Consider the word $abababa$.

Following are some examples of ambiguous grammar:

- $S \rightarrow aS \mid Sa \mid \epsilon$
- $E \rightarrow E + E \mid E * E \mid id$
- $A \rightarrow AA \mid (A) \mid a$
- $S \rightarrow SS \mid AB, A \rightarrow Aa \mid a, B \rightarrow Bb \mid b$

Whereas following grammars are unambiguous:

- $S \rightarrow (L) \mid a, L \rightarrow LS \mid S$
- $S \rightarrow AA, A \rightarrow aA, A \rightarrow b$

Exercise: Consider the grammar $P = \{S \rightarrow aS \mid aSbS \mid \epsilon\}$, construct the string aab with rightmost and leftmost derivation and draw the parse tree, explaining if this grammar ambiguous?

Simplifying Context-Free Grammars:

In order to construct good and efficient parsing algorithms, consider transformations of grammars, essentially simplifications of the form of productions, which lead to certain normal forms for grammars. These normal forms are better to deal with, and they allow more efficient parsing algorithms.

Types of redundant productions and the procedure of removing them are mentioned below:

1. Useless productions
2. Substitution Rule
3. Removing λ -productions
4. Removing unit productions

1. Useless productions:

The productions that can never take part in derivation of any string, are called useless productions. Similarly, a variable that can never take part in derivation of any string is called a useless variable.

Example 1:

$$\begin{aligned} S &\rightarrow abS \mid abA \mid abB \\ A &\rightarrow cd \\ B &\rightarrow aB \\ C &\rightarrow dc \end{aligned}$$

Note that the concept of 'useless variable' includes

- 1: The case that the variable does not lead to a terminal string.
- 2: The case that the variable cannot be reached from the start symbol.

In the example above, production $C \rightarrow dc$ is useless because the variable 'C' will never occur in derivation of any string. The other productions are written in such a way that variable 'C' can never be reached from the starting variable 'S'.

Production $B \rightarrow aB$ is also useless because there is no way it will ever terminate. If it never terminates, then it can never produce a string. Hence the production can never take part in any derivation.

The elimination of useless variables and productions from a grammar (or the selection of those variables and productions, which are useful) proceeds in two phases:

A. Determine and select those variables, which can lead to a terminal string, and subsequently determine and select the related productions.

B. Determine and select those variables, which can be reached from the start symbol, and select related productions.

In the example above, to remove useless productions, we first find all the variables which will never lead to a terminal string such as variable 'B'. We then remove all the productions in which variable 'B' occurs.

So, the modified grammar becomes:

$$S \rightarrow abS \mid abA$$

$$A \rightarrow cd$$

$$C \rightarrow dc$$

We then try to identify all the variables that can never be reached from the starting variable such as variable 'C'. We then remove all the productions in which variable 'C' occurs. The grammar below is now free of useless productions

$$S \rightarrow abS \mid abA$$

$$A \rightarrow cd$$

Example 2:

$$S \rightarrow aSb \mid \lambda \mid A$$

$$A \rightarrow aA$$

Cannot generate a terminal string, so variable A is useless.

Example 3:

$$S \rightarrow A$$

$$A \rightarrow aA \mid \lambda$$

$$B \rightarrow bA$$

Cannot be reached from S, so variable B is useless.

Example 4: Eliminate useless symbols from the grammar with productions:

$$S \rightarrow AB \mid CA$$

$$B \rightarrow BC \mid AB$$

$$A \rightarrow a$$

$$C \rightarrow AB \mid b$$

Step 1: Eliminate non-generating symbols, so the variables and productions will be:

$$V1 = \{A, C, S\}$$

$$P1 = \{S \rightarrow CA, A \rightarrow a, C \rightarrow b\}$$

Step 2: Eliminate symbols that are non-reachable.

All Variables are reachable. So, the final variables and productions are same V1 and P1.

$$V2 = \{A, C, S\}$$

$$P2 = \{S \rightarrow CA, A \rightarrow a, C \rightarrow b\}$$

Exercises: Eliminate useless symbols from the following grammars:

1. $P = \{S \rightarrow aAa, A \rightarrow Sb \mid bCC, C \rightarrow abb, E \rightarrow aC\}$

2. $P = \{S \rightarrow aBa \mid BC, A \rightarrow aC \mid BCC, C \rightarrow a, B \rightarrow bcc, D \rightarrow E, E \rightarrow d\}$

3. $P = \{S \rightarrow aAa, A \rightarrow bBB, B \rightarrow ab, C \rightarrow aB\}$

4. $P = \{S \rightarrow aS \mid AB, A \rightarrow bA, B \rightarrow AA\}$

2- Substitution Rule:

If a grammar contains a production $A \rightarrow x_1 B x_2$ with $A, B \in V$ and $A \neq B$ and $B \rightarrow y_1 \mid y_2 \mid \dots \mid y_n$ (alternatives) then construct a new grammar G' with a modified set of productions P' , in which replace the rules for A and B above with one set of rules: $A \rightarrow x_1 y_1 x_2 \mid x_1 y_2 x_2 \mid \dots \mid x_1 y_n x_2$. G and G' are equivalent, i.e. they generate the same language.

Example 5:

$A \rightarrow a \mid aaA \mid abBc$

$B \rightarrow abbA \mid b$

This grammar is equivalent to:

$A \rightarrow a \mid aaA \mid ababbAc \mid abbc$

3. Removing λ -productions

The productions of type ' $A \rightarrow \lambda$ ' are called λ productions (also called *lambda* productions and *null* productions). These productions can only be removed from those grammars that do not generate λ (an empty string). It is possible for a grammar to contain null productions and yet not produce an empty string.

To remove null productions:

1. we first have to find all the nullable variables. A variable ' A ' is called nullable if λ can be derived from ' A '. For all the productions of type ' $A \rightarrow \lambda$ ', ' A ' is a nullable variable. For all the productions of type ' $B \rightarrow A_1 A_2 \dots A_n$ ', where all ' A_i 's are nullable variables, ' B ' is also a nullable variable.

Example 1:

$S \rightarrow ABaC$

$A \rightarrow BC$

$B \rightarrow b \mid \lambda$

$C \rightarrow D \mid \lambda$

$D \rightarrow d$

Nullable set $V_N = \{A, B, C\}$

2. After finding all the nullable variables, we can now start to construct the null production free grammar. For all the productions in the original grammar, we add the original production as well as all the combinations of the production that can be formed by replacing the nullable variables in the production by λ . If all the variables on the RHS of the production are nullable, then we do not add ' $A \rightarrow \lambda$ ' to the new grammar. In another words, for two nullable variables on the RHS, remove one, remove the other, remove both, remove none. An example will make the point clear.

Example 2:

Consider the grammar:

$$S \rightarrow ABCd \quad (1)$$

$$A \rightarrow BC \quad (2)$$

$$B \rightarrow bB \mid \lambda \quad (3)$$

$$C \rightarrow cC \mid \lambda \quad (4)$$

- First find all the nullable variables. Variables 'B' and 'C' are clearly nullable because they contain ' λ ' on the RHS of their production. Variable 'A' is also nullable because in (2), both variables on the RHS are also nullable. So, variables 'A', 'B' and 'C' are nullable variables.

- Create the new grammar. We start with the first production. Add the first production as it is. Then we create all the possible combinations that can be formed by replacing the nullable variables with λ . Therefore, line (1) now becomes ' $S \rightarrow ABCd \mid ABd \mid ACd \mid BCd \mid Ad \mid Bd \mid Cd \mid d$ '. We apply the same rule to line (2) but we do not add ' $A \rightarrow \lambda$ ' even though it is a possible combination. We remove all the productions of type ' $V \rightarrow \lambda$ '. The new grammar now becomes:

$$S \rightarrow ABCd \mid ABd \mid ACd \mid BCd \mid Ad \mid Bd \mid Cd \mid d$$

$$A \rightarrow BC \mid B \mid C$$

$$B \rightarrow bB \mid b$$

$$C \rightarrow cC \mid c$$

Example 3:

Find out the grammar without ϵ - Productions $G = (\{S, A, B, D\}, \{a\}, \{S \rightarrow aS \mid AB, A \rightarrow \lambda, B \rightarrow \lambda, D \rightarrow b\}, S)$

Nullable variables = $\{S, A, B\}$

New Set of productions:

$$S \rightarrow aS \mid a$$

$$S \rightarrow AB \mid A \mid B$$

$$D \rightarrow b$$

$$G_1 = (\{S, B, D\}, \{a\}, \{S \rightarrow aS \mid a \mid AB \mid A \mid B, D \rightarrow b\}, S)$$

Exercises: Eliminate λ - productions from the grammar

$$1. S \rightarrow a \mid Xb \mid aYa, X \rightarrow Y \mid \lambda, Y \rightarrow b \mid X$$

$$2. S \rightarrow Xa, X \rightarrow aX \mid bX \mid \lambda$$

$$3. S \rightarrow XY, X \rightarrow Zb, Y \rightarrow bW, Z \rightarrow AB, W \rightarrow Z, A \rightarrow aA \mid bB \mid \lambda, B \rightarrow Ba \mid Bb \mid \lambda$$

$$4. S \rightarrow ASB \mid \lambda, A \rightarrow aAS \mid a, B \rightarrow SbS \mid A \mid bb$$

Example 4:

Eliminate ϵ - productions and useless symbols from the grammar

$$S \rightarrow a \mid aA \mid B \mid C$$

$$A \rightarrow aB \mid \lambda$$

$$B \rightarrow aA$$

$$C \rightarrow aCD$$

$$D \rightarrow ddd$$

Step 1: Eliminate ϵ - productions

Nullable = {A}

$$P1 = \{S \rightarrow a \mid aA \mid B \mid C, A \rightarrow aB, B \rightarrow aA \mid a, C \rightarrow aCD, D \rightarrow ddd\}$$

Step 2: Eliminate useless productions

a: Eliminate non-generating symbols, Generating = {D, B, A, S}

$$P2 = \{S \rightarrow a \mid aA \mid B, A \rightarrow aB, B \rightarrow aA \mid a, D \rightarrow ddd\}$$

b: Eliminate non-reachable symbols, D is non-reachable, eliminating.

$$P3 = \{S \rightarrow a \mid aA \mid B, A \rightarrow aB, B \rightarrow aA \mid a\}$$

4. Unit productions:

The productions of type ' $A \rightarrow B$ ' are called unit productions. To create a unit production free grammar 'Guf' from the original grammar 'G', we follow the procedure mentioned below.

First add all the non-unit productions of 'G' in 'Guf'. Then for each variable 'A' in grammar 'G', find all the variables 'B' such that ' $A \Rightarrow B$ '. Now, for all variables like 'A' and 'B', add ' $A \rightarrow x_1 \mid x_2 \mid \dots \mid x_n$ ' to 'Guf' where ' $B \rightarrow x_1 \mid x_2 \mid \dots \mid x_n$ ' is in 'Guf'. None of the $x_1, x_2, \dots, x_n$ are single variables because we only added non-unit productions in 'Guf'. Hence the resultant grammar is unit production free.

Example 5:

$$S \rightarrow Aa \mid B$$

$$A \rightarrow b \mid B$$

$$B \rightarrow A \mid a$$

Lets add all the non-unit productions of 'G' in 'Guf'. 'Guf' now becomes:

$$S \rightarrow Aa$$

$$A \rightarrow b$$

$$B \rightarrow a$$

Now we find all the variables that satisfy ' $X \Rightarrow Z$ '. These are ' $S \Rightarrow B$ ', ' $A \Rightarrow B$ ' and ' $B \Rightarrow A$ '. For ' $A \Rightarrow B$ ', we add ' $A \rightarrow a$ ' because ' $B \rightarrow a$ ' exists in 'Guf'. 'Guf' now becomes:

$$S \rightarrow Aa$$

$$A \rightarrow b \mid a$$

$$B \rightarrow a$$

For ' $B \Rightarrow A$ ', we add ' $B \rightarrow b$ ' because ' $A \rightarrow b$ ' exists in 'Guf'. The new grammar now becomes

$$S \rightarrow Aa$$

$$A \rightarrow b \mid a$$

$$B \rightarrow a \mid b$$

We follow the same step for ' $S \Rightarrow B$ ' and finally get the following grammar

$$S \rightarrow Aa \mid b \mid a$$

$$A \rightarrow b \mid a$$

$$B \rightarrow a \mid b$$

Now remove $B \rightarrow a|b$, since it doesn't occur in the production 'S', then the following grammar becomes,

$$S \rightarrow Aa|b|a$$
$$A \rightarrow b|a$$

Note: To remove all kinds of productions mentioned above, first remove the null productions, then the unit productions and finally, remove the useless productions. Following this order is very important to get the correct result.

Example 6: Simplify this grammar:

$$S \rightarrow Aa|B$$
$$B \rightarrow A|bb$$
$$A \rightarrow a|bc|B$$

Remove unit productions ($S \rightarrow B$, $B \rightarrow A$, $A \rightarrow B$)

$$S \rightarrow Aa$$
$$B \rightarrow bb$$
$$A \rightarrow a|bc$$

Add:

$$S \rightarrow bb|a|bc$$
$$A \rightarrow bb$$
$$B \rightarrow a|bc$$

Finally, we get:

$$S \rightarrow a|bc|bb|Aa$$
$$A \rightarrow a|bc|bb$$
$$B \rightarrow a|bc|bb$$
