Abstract

My graduation project deals with the topic of creating a website for car maintenance services. The project aims to facilitate and improve the car maintenance process for users by providing an electronic platform that connects car owners with maintenance centers. The site allows users to easily book maintenance appointments for their cars, in addition to providing comprehensive information about available maintenance services, their prices, and user ratings...

The project aims to benefit users and center owners alike, as center owners can promote their services and increase the number of potential customers, while users benefit from improving the time and effort invested in maintaining their cars.

In short, the project to create a website for car maintenance services is an innovative and practical idea that aims to facilitate and improve the car maintenance process and provide an excellent experience for users.
