Create an advanced key logger in python

Abstract:

A keylogger is a type of software or hardware device that records every keystroke typed on a keyboard, including passwords, credit card numbers, and other sensitive information. Keyloggers can be installed on a computer or mobile device without the user's knowledge, and the data collected can be sent to a remote location where it can be accessed by an attacker.

Keyloggers can be used for various purposes, including monitoring employee activity, parental control, and cybercrime. However, using a keylogger to monitor someone without their knowledge or consent is illegal in many jurisdictions. It's important to use antivirus software and be cautious of suspicious emails or downloads to protect against keyloggers and other types of malware.
