تصميم برنامج مراقبة نمو الطفل

Abstract

This project was chosen because of its importance in monitoring the child's growth, knowing his medical needs, and knowing some information about him, and this will help the mother a lot in caring for her child. The way we worked on this project was to design a mobile application that works on Android and Apple through Flutter, Dart, and a special database.

We used several things in this application, such as entries and other things that will be mentioned later in other chapters. We achieved good results while using this application, which are beneficial for the child and the mother as well. At the same time, several additions can be added to it in the future that will help the mother and child a lot and contribute to the development of the application as well and make it important in this field.
