Abstract

In more of cases of losing our phones, and after a big research, we can't find it. We knew that our phones contain photos, special messages, conversations ets, fore there, we should guard these important things. After sending a message to the lost phone, this new application will allow to us to identify that the number who sends the message is trusted or not.

The idea of my project stands on creating an application APK, installed on the device, before it will be lost. This application can recognize the GPS and another features that will be mentioned.

Before that the device is lost, special parameters are done, as trusted phone number, special messages. Theses parameters will be used to identify the person who wants to control some privileges, about **SMS messages**.

After the device is lost, the phone owner will send a **special message** from the number phone setting before. These special messages are set before contain special privileges.
