Build a Professor-Student Management system

Abstract

In the realm of educational institutions, the efficient management of professorstudent interactions is crucial for the smooth functioning and academic success of both parties. The advent of technology has provided avenues for enhancing this management process through the development of Professor-Student Management Systems (PSMS). This abstract presents an overview of a proposed PSMS designed to streamline and optimize various aspects of the professor-student relationship within academic institutions. The system aims to facilitate effective communication, assignment submission, grading, feedback exchange, and overall administrative tasks.
