Designing and implementing a web based digital library

Abstract

One of the most important things that help in the development of office and scientific work at the present time is how to facilitate and simplify it to a more suitable degree for work and sufficiently developed to make it commensurate with modernity and technology. One of the most important problems that students face in the process of borrowing books is the difficulty of finding the book easily and knowing whether the book is available or not, in addition to the time wasted during this process. It is something that requires time and effort. Through this project, we aims to simplify all these matters and introduce modernity, speed and development into the (e-library) room. This project is a website available on the Internet that facilitates the process of borrowing books and study resources for the student, as well as facilitating the work of the administrator in the library to a large degree. Use Microsoft Visual Studio 2022 and used language C#.
