Abstract

Back ground:

According to the World Health Organization (WHO), ensuring access to preferred contraceptive methods for women is essential to supporting the health of mothers and children and the community's economic situation.

Objectives of the study to find out the relationship between socio demographic, data with Knowledge toward contraceptive methods.

Methodology:

A descriptive analytic design: Non-probability was conducted on (Purposive sample) of (100) postpartum women who attending; Babylon maternity and children 'AL.Imam Sadeq teaching hospitals in Al-Hilla City. A questionnaire has been used as a tool of data collection for the period of period of (28th Jan _ 18th Feb / 2023).

Results:

The results recorded that the most of sample (31.0%) were between age group (26-30) years, The Women's knowledge toward contraceptive methods and Knowledge related to the side effects, were the poor level, there is significant relationship between demographics and knowledge of participants toward contraceptive with all items except (occupation, Source of information) and there is significant relationship between obstetric of women and knowledge of contraceptive.

Conclusion:

The Women's knowledge toward contraceptive methods, were poor level. Knowledge related to the side effects, of contraceptives were poor level.

Recommendations:

Health education through Ministry of Health for all women during preconception care and during pregnancy about family planning (contraceptives).

Keywords: Knowledge, Attitudes, Postpartum, Contraceptive,

Chapter one Introduction

1.1 Introduction

The postpartum period is a crucial time to prevent short inter-pregnancy interval and unwanted pregnancies. Despite, it is the most ideal period to create attention regarding knowledge and attitudes of postpartum mothers about contraceptive methods; it is the most neglected part of the continuum of care. (Taye, E., etal, 2021).

Family planning (FP) is the ability of individuals and couples to anticipate and attain their desired number of children and the spacing and timing of their births which is achieved through the use of contraceptive methods. It is also a way of thinking and living that is adopted voluntarily upon the basis of knowledge, attitude, and responsible decisions by individuals and couples (Kesetebirhan A., 2011)

The benefits of contraceptive utilization accrue to women themselves, their children, and community. Additionally, contraceptive use during the postpartum period plays a great role in improving the lives of women and their families (Cleland J., etal, 2012).

Family planning enables couples to obtain their desired number of children and determine the spacing of pregnancies, which is achieved mainly through contraceptive methods. Contraception (birth control) prevents unwanted pregnancy by interfering with the normal process of ovulation, fertilization, and implantation. Birth control methods are numerous and characterized by different mechanisms of action and effectiveness in preventing pregnancy. According to the World Health Organization (WHO), ensuring access to preferred contraceptive methods for

women is essential to supporting the health of mothers and children and the community's economic situation (Rodriguez, M.I., et al, 2014).

Women have an opportunity for accessing the healthcare system during the postpartum period which further increased their motivation to avoid another pregnancy using contraceptives. Following childbirth, pregnancy can occur within 45 days of giving birth, even before menses resumes. Thus, late initiation of contraceptive use in the postpartum period could increase the risk of unintended pregnancy. The World Health Organization (WHO) recommended initiation of postpartum contraceptive utilization within 6 weeks after delivery (WHO.2014).

Maternal health problems remain a major global concern since pregnancy and childbirth are the leading causes of morbidity and mortality among reproductive age women. Evidences have shown that encouraging early antenatal care visits, institutional deliveries, postnatal care, and contraceptive adoption are the key elements in improving safe motherhood. As the first pillar of safe motherhood and an essential component of primary health care, contraceptive plays a key role in reducing maternal and newborn morbidity and mortality by preventing unintended pregnancy and close birth intervals (Kassebaum JN., etal, 2014)

A closed birth interval would endanger the lives of the mother, the newborn, and the (previously delivered child). When a mother becomes pregnant shortly after childbirth, she is more likely to develop complications including spontaneous abortion, postpartum bleeding, and anemia. Secondly, the newborn could be born low birth weight and/or preterm. Thirdly, the index child (previously delivered child) might receive inadequate care and support which, thereafter, could lead to vulnerabilities to disease and malnutrition (Subhi R, etal, 2011).

The majority of women resume sexual activity within several weeks of the delivery. The amount of time following delivery that a woman is infertile is highly variable and dependent on multiple factors, including breastfeeding status. Ovulation can occur even if the mother has not resumed menstruation and could happen as early as 25 days postpartum. The probability of ovulation occurring before resumption of menstruation increases over time. Postpartum family planning (PPFP) focuses on the prevention of unintended and closely spaced pregnancies through the first 12 months following childbirth. Unmet needs could lead to unplanned and unintentional pregnancies which will increase the risk of adverse maternal and neonatal health outcomes (WHO 2013)

In Middle Eastern countries, cultural values and traditions are among the factors that affect the extent of contraception use. Also must increase women's knowledge and improving their attitude on postpartum modern contraceptive methods is essential to improve their quality of life (Barbour, B.; 2009).

1.2 Objectives:

- 1. To assess Demographical data and obstetric information of pregnant women.
- 2. To identify Knowledge of participants toward contraceptive.
- 3. To find out the relationship between socio demographic, obstetric with Knowledge toward contraceptive methods.

Chapter Two

Methodology

CHAPTAER2METHODS

2.1 Methodology

Descriptive analytic study design. Non probability (purposive sampling) consist of 100 postpartum women who attending; Babylon Maternity and children hospital 'AL.Imam Sadeq teaching hospitals in Al-Hilla City. A questionnaire was used as a data-gathering tool, the questionnaire and content validity has been carried out through the (4)experts. Descriptive and inferential statistical analyses are used to analyze the data The study carried out from (28th Jan _ 18th Feb / 2023) Data collected through a questionnaire constructed for the purpose of this study, consists of 3 parts include:

1st:

A: Demographic Data

This part concerned with Demographic Data include (6) items (Age, Educational level, residence, occupation, economic status, sours of information).

B: Obstetric information

Consist of (3) items related to reproductive characteristics (No. of gravida, No. of para, the No. of children).

2st:

A: knowledge of women toward contraceptive

This part Consists of (11) items these items are rated according to three level Likert scale (I know, I'm not sure, I don't know) and scored (1, 2, 3).

B: Knowledge of pregnant women about side effects of contraceptives

This part consists of (14) items (Headache, Irregular bleeding, Weight gain, Fatigue, Backache, Nausea, Abdominal pain, Vertigo, Increase heart beats, Pains in whole body, Depression, Nervous & anxiety, Increase blood pressure,

CHAPTAER2	M	\mathbf{FT}	HC	JΓ	9.
	 . 1 V I	டப		,,,	•

Infection) These items are rated according to two level Likert scale (Yes, No) and scored (1, 2)

Part 3: Postpartum women's attitudes toward contraceptiones

This par consist of (10) items these items are rated according to three level Likert scale (Agree, Neutral, Disagree) and scored (1, 2, 3). Data were analyzed using Descriptive and Inferential statistical for Social Sciences (SPSS) version (26).

Economic status	Somewhat Sufficient	28	28.0
	Enough	58	58.0
	Not Enough	14	14.0

	Total	100	100.0
Source of information's	Family Members and Friends	54	54.0
	Colleagues	22	22.0
	TV And the Internet	5	5.0
	Private Doctors or Nurses	12	12.0
	Other	7	7.0
	Total	100	100.0

Table (1): this table demonstrated the demographical characteristics of the study sample, the results recorded that the highest percent (31.0%) were between age group (26-30) years old. The highest percent (47.0%, 58.0%, 74.0%, 58.0) (respectively). Were diploma or college educational level, housewife, rural residency, were their levels of economic status enough. The highest percent (54.0%) the source of information's were family members and friends.

Table 2: Distribution Obstetrics Information of Postpartum Women (No. 100)

Variables	Groups	Frequency	Percent
	1-2 56 3-4 33	56.0	
Number of pregnancies	3-4	33	33.0
The second secon	5 or More	11	11.0
	Total	100	100.0
	1-2	56 33 11 100 53 37 10	53.0
Number of births	3-4	37	37.0
	5 or More	10	10.0
	Total	100	100.0

Number of living children	1-2	55	55.0
	3-4	36	36.0
	5 or More	9	9.0
	Total	100	100.0

Table (2): this table demonstrated the highest percentage (56.0%) were 1-2 as number of pregnancies, related to number of birth (53%) were 1-2, also (74.0%) were not abortion, related to number of children the percentage (55.0%) were 1-2 child

5	Economic status	71.695ª	22	.010
				S
6	A source of information	65.159ª	44	.021
				S

Table (8.): shows there is significant relationship between demographics and all items related to knowledge toward side effects except with (, occupation).

Table (9): The relationship between obstetric information and knowledge toward side effects

No	Relationship between obstetric information and knowledge toward side effects	Side effects of contraceptives Chi square value	DF	Significance
1	Number of pregnancies	52.582ª	22	.000 HS
2	Number of birth	58.081ª	22	.000 HS
3	Number of children	67.563 ^a	33	.000 HS

Table (9): shows there is high significant relationship between obstetric information and knowledge toward side effects

Chapter Four

Discussion

CHAPTER4.....DISCUSSION

4.1 Discussion

Table 1: Distribution Demographical Characteristics Related to Postpartum Mother

The highest percentage of sample (31.0%) were between age group (26-30) years old, This finding is similarity with study of by (Bajracharya,2015) done in Nebal found that (90.25%) the sample were between (20-34) years old. related to educational status most of study sample (47.0%) were diploma or college these results in the same line with another study conducted by (Taye, E.,2021) don in Debre Tabor Town, Northwest Ethiopia who reported (62.3%) were High school and above.

Regarding occupation, The highest percentage (58.0%) were Housewife, these results supported by another study conducted in South West Ethiopia (Wodaynew T,,2021) in his study the result recorded (54.7%) were house wife.

Table 2: Distribution Obstetrics Information of Postpartum Women

Regarding the mother's obstetric history of the study sample, the results recorded that the highest percentage (56.0%) were 1-2 as number of pregnancies , These results were Approves with another study conducted in Saudi Arabia by (Mahfouz, M.S., 2023) (34.3%) of the sample were (1_2) as number of pregnancies .

Concerning the number of birth (53%) were 1-2, these result supported by (Mahfouz, M.S., 2023) recorded (37.3%) of sample were (1_2) as number of birth.

CHAPTER4.....DISCUSSION

Table 3: Women's knowledge toward Contraceptive Methods

The highest percentage (96%) of postpartum women had heard about contraceptive This agreement with study of (Tenggara, Bodhi, 2017) that 86% of woman had heard about contraceptives The result of the item (Best time to start taking birth control pills Oral route is the first five days) that show "lam not sure "in the same line with study done in End District, East Nusa (Tenggara, Bodhi, 2017)

Table 4: Knowledge of Sample Related to the Side Effects of Contraceptives

knowledge related to the side effects, the results recorded that the general mean for study sample was poor this study disagreement with another study conducted in (Saudi Arabia) by (Mahfouz, M.S., 2023) showed that there is an increased knowledge of contraceptive side effects use among Saudi women. Regarding the Postpartum attitudes toward contraception, the results recorded that the mild level, compared with a study conducted Adama in (Abraham, Z., 2016) shows that accordingly more than half (56.4%) of the respondents have positive attitude and support use of contraceptives and (43.6%) of them ad negative attitude for contraceptive use.

Table (8): The relationship between demographics and knowledge of sample toward side effects of contraceptives

Regarding the significant between demographics and knowledge of contraceptive orientation related to (educational level) in $P \leq 0.05$, this result is in the same line with study conducted by (Bajracharya A., 2015) that recorded the level of women's education had a

CHAPTER4......DISCUSSION

significant impact on future use and non-use of postpartum contraception.

Table (9): The relationship between obstetric information and knowledge toward side effects

Concerning The relationship between obstetric demographics and knowledge of side effects related to (Number of pregnancies, Number of children) in $P \leq 0.05$, this result is in the same line with study conducted by (Mahfouz, M.S, 2015) show significances with number of children and number of pregnancies with $P \leq 0.05$

Chapter Five Conclusion & Recommendations

Conclusion and Recommendations

5.1 Conclusion:

- 1. The results recorded that the most of sample 31 (31.0%) were between age group (26-30) years.
- 2. The Women's knowledge toward contraceptive methods, were poor level.
- 3. Knowledge related to the side effects, of contraceptive were poor level.
- 4. The Postpartum attitudes toward contraceptives, the results recorded good level.
- 5. There is significant relationship between demographics and knowledge of participants toward contraceptive with all items except (occupation, Source of information).
- 6. There is significant relationship between obstetric of women and knowledge of contraceptive.
- 7. There is significant relationship between demographics and all items related to knowledge toward side effects except with (, occupation).
- 8. There is high significant relationship between obstetric information and knowledge toward side effects

5.2 Recommendations

Based on the finding of this study we would like to recommend:

- 1. Health education through Ministry of Health for all women during preconception care and during pregnancy about family planning.
- 2. Ministry of Health focus through encouragement of women through Media/ TV, Radio, Posters, etc. On planning pregnancy and interval between one and another pregnancy and providing it for all mothers in little cost,.
- 3. Encouragement of women in primary health centers on the advantage and the importance of family planning through consultation with their health care provider to choose the suitable.
- 4. Further studies are needed to cover various aspects of contraceptives.

1. To assess Demographical data and obstetric information of postpartum. 2. To assess Knowledge, attitudes and Practices of participants toward contraceptive. 3. To find out the relationship between socio demographic, obstetric with Knowledge, attitudes and Practices toward contraceptive methods. 1St part A: Demographical data 1. Age: years 2. Educational level: Don't Read and Write Read and Write Secondary Institute or College 3. Occupation: Employed House wife **4. Residency:** Urban Rural **5. Economic level:** Enough To Some Extent Enough Not Enough **Source of information:** 1-family members and friends: 2-colleagues: 3-TV and net: 4-private physicians or nurses 5-others: **B.** Obstetric information 1. Number of pregnancy (Gravida): 1-2 5or more 3-4

5or more

2. Para:

1-2

3. Number of children.

 2^{nd} part: A/ knowledge of women toward contraceptives.

No.	Items	I know	I'm not sure	Don't know
1.	You know meaning of contraceptive			
2.	Contraceptive have side effect			
3.	You know exclusive breastfeeding type of contraceptives			
4.	Oral contraceptive pill(Estrogen) not to be given to a breastfeeding mother			
5.	There is a permanent method (female/male) to prevent Pregnancy			
6.	There are two types of contraception Inside the womb			
7.	There are small pills for emergencies if you forgot to take a daily pill			
8.	Best time to start taking birth control pills Oral route is the first five days			
9.	There is injection method called Depo			
10.	You heard of the natural method of contraception			
11.	Barrier methods of contraception			

2^{nd} Part: Knowledge about Side Effects of contraceptives

No.	Items	Yes	No
	Your Experience While Using the Contraceptive?		
A.	Headache		
B.	Irregular bleeding		
C.	Weight gain		
D.	Fatigue		
E.	Backache		
F.	Nausea		
G.	Abdominal pain		
H.	Vertigo		
I.	Increase heart beats		
J.	Pains in whole body		
K.	Depression		
L.	Nervous & anxiety		
M.	Increase blood pressure		
N.	Infection		

3^{rd} part: Attitudes of postpartum toward contraceptives.

No.	Items	Agree	Neutral	Disagree
1.	I think discussing with my partner about family planning is important			
2.	I feel interested in learning about Planned family			
3.	Family planning use is important for women			
4.	I believe using family planning is important for the family			
5.	The large family size affects the development of the family			
6.	I interest to using Contraceptives			
7.	Counseling other women for family planning is a good fit			
8.	Having many children is a benefit for the family			
9.	A family that has many children is more respectable than a family that has many females			
10.	I think it is not a sin to use family planning
